Abstract of JP 2000333043 (A)

PROBLEM TO BE SOLVED: To efficiently production of contents by taking a transmission time of the contents into account and to secure the operation of a service. **SOLUTION:** A user interface section 354 reads a file of required components, decodes it and displays laid-out components. When edit of a scene is finished, an MHEG script is generated, and a module file in the unit of scenes is generated by incorporating media data corresponding to the components in the scene with the script. The interface section 354 sets a transmission schedule, enters contents relating information and generates an attached information file by entering transmission priority. A fire compression merge section 359 applies compression and merge to a module file group in the unit of scenes and the attached information file to generate a contents file 360. The contents file 360 is outputted to a transmitter.
